3. Writing

Understanding part:

After learning about Vue 3 in the Vue Mastery course (Lessons 1-4), I learned how to build a clear and structured Vue application. First, I learned how Vue 3 connects data to the user interface through reactive state. Instead of manually updating the DOM, in Lesson 1 I learned that Vue automatically updates the user interface whenever data changes using `createApp({...}).mount('#app')` and modifies object information via `data()`, which makes the code cleaner and easier to maintain. I also understood the purpose of creating a Vue application instance, and attaching it to a specific element, because that's how Vue "controls" the page it manages. Additionally, I practiced using Vue directives like `v-bind`, `v-if`, and `v-show` to control conditional display, and `v-for` to display a list based on data. Overall, these lessons helped me see Vue 3 as a component-based, data-driven framework where templates and logic work together seamlessly. With this foundation, I feel more confident moving from simple examples to smaller, real-world projects and interactive user interfaces.
